Baylor Plaza, Houston, TX 77030, USA.

On Nov 19, 2002 this sequence version replaced gi:23265864.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence ontigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence reads. Both end sequences and whole genome shotgun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft" sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                 Direct Submission

Direct Submission

Submitted (13-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

On Nov 13, 2002 this sequence version replaced gi:23664539.

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas and whole genome shotgun sequencing reads assembled using Atlas in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence colly contigs will be indicated in the feature table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html) NOTE: This sequence may represent more than one clone.

NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Assembly program: Phrap; version 0.990329

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3413: contig of 3413 bp in length

sample comprising: contacting the sample with a mutant analyte-binding enzyme which has binding affinity for the analyte or an immediate analyte enzymatic conversion product but has attenuated catalytic activity; and detecting resulting binding. The method is useful in monitoring biological systems/processes, or prognosis/diagnosis of disease caused by imbalances of the analytes. The present sequence is a coding sequence used in the present invention. Note: the present sequence is not shown in the specification, but was from Genbank, using information given in the specification.	Query Match Best Local Similarity 99.8%; Pred. ```
The present invention provides a novel method of estimating the susceptibility of an individual to a developmental disorder using genetic and environmental variables. The method can be used in the diagnosis, prevention and treatment of disorders such as schizophrenia, spina bifida cystica, Tourette's syndrome, bipolar illness, autism, conduct disorders, attention deficit disorder, obsessive compulsive disorder, chronic multiple tic syndrome and learning disorders such as dyslexia
                                                                                                                                                                                                           Diagnosing a developmental disorder, e.g. schizophrenia, by forming datasets (DS) of genetic (e.g. genotypes of folate metabolism alleles) and environmental variables affecting an individual and then comparing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TGATCCAGCGGGAGAAGCTAAACGAAGAACACTTCCGAGGTCAGGAATTTAAAGATCATG

The present invention relates to a method (M1) for estimating the susceptibility of an individual to have offspring that develop a develop a developmental disorder. The method comprises analyzing the nucleic acids and/or proteins from the biological sample, where analyzing results in a partial or full genotype for the alleles of two or more genes involved in clate, pyridoxine, and/or cobalamin metabolism. The present sequence is one such gene involved in folare metabolism. The method is also useful for diagnosing, preventing, and treating developmental disorders, e.g. obsessive-compulsive disorder. The protein encoded by the present sequence is also known as 5-methyltetrahydrofolate-homocysteine S-Neuroleptic; Nootropic; Tranquilizer; folate metabolism; psychiatric disorder; schizophrenia; autism; attention deficit hyperactivity disorder; obsessive-compulsive disorder; gene; ds; Methionine synthase; chromosome 1. Estimating the susceptibility of an individual to have offspring that develop a developmental disorder comprises analyzing the nucleic acids and/or proteins for genes involved in folate, pyridoxine, and/or GTCACCTGTGGAGAGCACGTCTTCTCTGCCGCGCCCTCTGCGCAAGGAGGAGACTCGACA ACATGTCACCGGGGCTCCAAGACCTGTCGCAACCCGAAGGTCTGAAGAAAACCCTGCGG 62 ACATGTCACCCGCGCCTCCAAGACCTGTCGCAACCCGAAGGTCTGAAGAAAACCCTGCGGG The present sequence is located on chromosome 1q43. The method is useful in monitoring biological systems/processes, or prognosis/diagnosis of disease caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ethod, useful for prognosis and diagnosis of disease, comprises sample with a mutant analyte-binding enzyme and detecting

of methionine by growing a sulphur-producing Coryneform bacteria that
expresses at least one heterologous nucleic acid encoding a protein with
methionine synthase (MetH) activity. Methionine accumulates in the medium
or the cells. The method can be used to produce an L-methionine-
containing animal feed additive by culturing an L-Methionine-
containing animal feed additive by culturing an L-Methionine-
microorganism, removing water from the resulting broth, removing 0-100%
of the biomass formed and drying the product to produce the feed additive
cof in powdered or granular form. The nucleic acid encoding MetH has sequence

corynebacterium gluteamicum ATCC 1303. Optionally at least one other gene
corynebacterium gluteamicum strongeness or 3-phosphoglycerate kinase) is
also amplified or mutated so that it is not affected by metabolites. Also
at least one metabolic pathway that reduces production of methionine is
at least partly switched off (e.g. homoserine kinase, threonine
corynebacterium synthase). The method is sepecially used
corynebacterium synthase). The method is sepecially used
corynebacterium synthase and pharmacentical ar whis seminal mutation or metabolical and pharmacenticals. This seminal section of method or animal section or animal sections.
                                                                                                                                                                                                                                                                                                       Fermentative production of sulfur-containing compounds, particularly L-methionine, useful as feed additives, by using Coryneform bacteria that overexpress methionine synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             animal nutrition, cosmetics and pharmaceuticals. This sequence encodes metH protein described in the disclosure of the invention.
                                                                                                                                                                                                               ŝ

EST clone GA64.

```
This invention relates to novel, isolated full length human cDNA molecules and the encoded proteins thereof. Specifically, it refers to cDNA clones obtained by an oligo-capping method, where none of these clones are identical to any known human mRNAs. The present invention describes an immunoassay to identify agonists and antagonists, as well as antibodies, antisense molecules and siRNAs that can all be used to bind to and modulate expression of the CDNA molecules. As such, these molecules are useful for diagnostic markers or therapeutic targets for the various diseases or morbid states. In particular, they are useful in gene therapy for treating osteoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia, short memory and various cancers,
                                                                                                                                                                                                   New 1995 cDNA, useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for treating emotional reaction, fear response and panic. Accordingly, they exhibit osteopathic, neuroprotective, nootropic, antiparkinsonian, eytostatic and tranquiliser activities. This polynucleotide is a full length human cDNA sequence of the invention. NOTE: This sequence is not given in the sequence listing of the specification but can be obtained or

The present sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, tissue growth activity, haemostatic activity, chemotactic/chemokinetic activity, activity, chemotactic/chemokinetic activity, aemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene therapy

- derived from e.g.

New polynucleotides encoding human secreted proteins - derived fr human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries.

The invention relates to a novel oligomucleotide array comprising a number of oligomucleotides derived from an orthologue gene of a different corganism or species immobilised on a support body. The oligomucleotide array has two sides comprising a gene derived from two different corganisme, in which one side comprisies a human gene. In the oligomucleotide array a base sequence differs in a different position on the support body. Each of the oligomucleotides is a partial sequence of the orthologue gene of the organism apecies A and the organism B. The sequence match degree of the organism species A and the organism species B is less than 70%. The sequence homology of the genes other than the orthologue gene of the organism species A and the organism species B is the level-of. The cound value or the calculated using the homology searching algoment search tool (BLAST) and the value is 0.1 or more. The found value or the calculated value of the milting to remperature of the variant genes other than the orthologue gene of the orthologue gene in different organisms. The method is useful for comparing expression change of the orthologue gene in different organisms. The method is useful for medical-agent administration and for comparing change of the function of the orthologue gene in different organisms. The oligomucleotide array has the orthologue gene in different organisms. The oligomucleotide array has the orthologue gene in different organisms. The oligomucleotide array has two or more types of organism simultaneously. The oligomucleotide array is the organism simultaneously. The oligomucleotide array is incomparism simultaneously. The oligomucleotide array is the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Oligonucleotide array, useful for measuring ortholog gene-expression distribution, comprising number of oligonucleotides derived from ortholog gene of different organism immobilized on support.
                                                                                                                                                                                                                                                                                                                                                                                                         oligonucleotide array, orthologue, homology, expression distribution, change, gene-expression, rat, probe, 88.
                                                                                                                                                                                                                                                                                                                        Oligonucleotide array related rat oligonucleotide probe No 75.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 44; DB 12; Length 80;

Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or discover (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a

```
(AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Revised record issued on 04-NOV-2004 : Correction to Feature Table Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to the identification of nucleic acid molecules
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human, resequence, genotype, disease, forensic, paternity testing, single nucleotide polymorphism; SNP; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the identification of nucleic acid molecules (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Revised record issued on 04-NOV-2004 : Correction to Feature Table Key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

```
The invention relates to the identification of nucleic acid molecules (AA129513-AA111314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or discover (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                      Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid molecules from the human genome which include polymorphic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                  The invention relates to the identification of nucleic acid molecules (AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence or severity of a particular phenotype or discoder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
                                                                                                                                                                                                 Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a

(AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity
s, useful in methods for predicting the presence, absence or severity particular phenotype or disorder (e.g. diabetes) associated with a

Nucleic acid molecules from the human genome which include polymorphic sites, useful in methods for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a of a particular phen particular genotype

Claim 1; Page 61; 145pp; English

The invention relates to the identification of nucleic acid molecules

(AAI29513-AAI31314) from the human genome which include polymorphic sites which can predispose individuals to disease. Various genes from a number of individuals were resequenced and single nucleotide polymorphisms (SNPs) in these genes discovered. The method is useful for predicting the presence, absence or severity of a particular phenotype or disorder (e.g. diabetes) associated with a particular genotype. The nucleic acids containing the polymorphic sites may be useful in forensics and paternity testing 8.58888888888

It corresponds to nucleotides 2432-2405 of the human methionine synthase cDNA open reading frame (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinsemla. The invention relates to the diagnosis and researchment of patients at risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for methion thase deficiency, and case and colon cancer. Claimed methods for detecting sequence variants involve

This is the nucleotide sequence of oligonucleotide 1772, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 2359-2384 of the human methionine synthase cDNA open reading frame (see AAV34064). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and cassociated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency and associated altered risk for methionine synthase deficiency.
                                                                                                                                                                                                                           DNA encoding methionine synthase polypeptide - and corresponding polypeptide, cells, antibody and therapeutic methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding methionine synthase polypeptide - and corresponding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a method of determining the genetic predisposition of a subject for development of thrombosis which comprises examining at least 2 nucleic acid segments from the genome, followed by multifactorial analysis of the results. The nucleic acid segments can contain allelic polymorphisms whose presence is correlated with an increased risk of thrombosis. The method is used to detect polymorphisms, or combinations of them, associated with increased inherited risk of allelic variants when present together, and requires only a single test kit (reducing time and costs). The present sequence represents a thrombosis predisposition PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Determining genetic disposition to thrombosis, by testing for presence of at least two allelic polymorphisms associated with increased risk, followed by multifactorial analysis of the results.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;

```
This is the nucleotide sequence of oligonucleotide 1796, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 2727-2752 of the human methionine synthase cDNA open reading frame (see AAV34063). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with
                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                    This is the nucleotide sequence of oligonucleotide 407A, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 151-176 of the human methionine synthase cDNA down reading frame (see AAV34064). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These chromosome mapping and in a claimed methionine synthase cDNA choning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperthomocysteinaemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency and associated altered risk for methionine synthase deficiency and associated altered risk for methiol the defects, cardiovascular disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;

This is the nucleotide sequence of oligonucleotide 1808, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 2458-2433 of the human methionine synthase cDNA open reading frame (see AAV34063). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Whitations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve SSCP or RFLP polymorphism analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

This is the nucleotide sequence of oligonucleotide 2606B, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 1139-1114 of the human methionine synthase cDNA open reading frame (see AAV34064). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with treatment of patients at risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for metual tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve

The invention relates to a secretory polynucleotide (designated sptm)

comprising any of 567 polynucleotide sequences (ABZ15837-ABZ36403), a

naturally occurring polynucleotide sequence at least 90 % identical to

the polynucleotide sequence, a polynucleotide complementary to them or an

Everting, preventing or diagnosing a disease or condition associated with

treating, preventing or preventing autoimmune/inflammatory disorders

the expression of functional SPTM. These are particularly useful for

diagnosing, treating or preventing autoimmune/inflammatory disorders

(e.g. acquired immunodeficiency syndrome, ansemia, asthma or Crohn's

disease), neurological disorders (e.g. epilepsy, Huntington's disease,

dementia, stroke, Alzheimer's disease, Creutzfeldt-Jakob disease,

multiple sclerosis, crerabral palsy, Parkinson's disease,

multiple sclerosis, crerabral palsy, Parkinson's disease,

schizophrenia or amnesia), or cell proliferative disorders (e.g.

schizophrenia, lymphoma, melanoma, melanoma, sarcoma or cancers of the brain,

breast, cervix or prostate). Note: The sequence data for this patent did

contactly from WIPPO at ftp. Wipo.int/pub/published_pot_sequences Claim 1; SEQ ID NO 190; 458pp + Sequence Listing; English.

```
This is the nucleotide sequence of oligonucleotide 1907C, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 1464-1488 of the human methionine synthase CDNA open reading frame (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase CDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and treament of patients at risk for methionine synthase deficiency, aind associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve SSCP or RFLP polymorphism analysis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of oligonucleotide 1828, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 1125-1149 of the human methionine synthase CDNA open reading frame (see AAV34063). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase CDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocygteinaemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve SSCP or RFLP polymorphism analysis
                                                                                                                                                                                                                                                                                Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;

```
chromosome mapping and in a claimed method for mutation detection.

Mutations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve
                                                                                        This is the nucleotide sequence of oligonucleotide 2606A, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 1078-1054 of the human
                                                                                                                                                            methionine synthase cDNA open reading frame (see AAV34063). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning,
  polypeptide, cells, antibody and therapeutic methods.
                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 25 BP; 8 A; 7 C; 4 G; 6 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1117 GAAGGACATATGTTACTGTCTGGTC 1141

                                                                                                                                                                                                                                                                                                                                                                       This is the nucleotide sequence of oligonucleotide 1907B, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 2057-2033 of the human methionine synthase cDNA open reading frame (see AAV34064-104) based on such conserved regions are provided. These (see AAV34064-104) based on such conserved regions are provided. These charme been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinsemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease
                                                                                                                                                                                                                                                         encoding methionine synthase polypeptide - and corresponding peptide, cells, antibody and therapeutic methods.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This is the nucleotide sequence of oligonucleotide 1827, a primer based on a highly conserved region found in the methionine synthases of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              different organisms. It corresponds to nucleotides 1657-1633 of the hum methionine synthase CDNA open reading frame (see AAV34064). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection.
                                                                                                                                                                                                       Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mutations in the human methionine synthase gene are associated with

This is the nucleotide sequence of oligonucleotide 2706B, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 3749-3725 of the human methionine synthase cDNA open reading frame (see AAV34064-104) based on such conserved regions are provided. These chromosome mapping and in a claimed methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinsemia. The invantion relates to the diagnosis and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve
                                                                                                                                                                     ö
          treatment of patients at risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve SSCP or RFLP polymorphism analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;

This is the nucleotide sequence of oligonucleotide 1773, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 2698-2674 of the human methionine synthase cDNA open reading frame (see AAV34063). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These chromosome mapping and in some methiodine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve
                                                                                                                                                                                                             Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the nucleotide sequence of oligonucleotide 1406D, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 2170-2194 of the human methionine synthase CDNA open reading frame (see AAV34063). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase CDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and associated altered a risk for methioninhe synthase deficiency, and associated altered risk for methioninhe synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for methioline synthase deficiency, and associated altered risk for methioline synthase deficiency and colon cancer. Claimed methods for detecting sequence variants involve SSCP or RFLP polymorphism analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;
                                                               Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA encoding methionine synthase polypeptide - and corresponding polypeptide, cells, antibody and therapeutic methods.

This is the nucleotide sequence of oligonucleotide 1707A, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 2129-2105 of the human methionine synthase cDNA open reading frame (see AAV34064). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These chave been used for human and mouse methionine synthase cDNA cloning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and cassociated altered risk for methionine synthase deficiency, and cassociated altered risk for methionine synthase deficiency and cassociated altered risk for methionine synthase deficiency, and caston cancer. Claimed methods for detecting sequence variants involve
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; 88.

New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant

The invention relates to 1/80 cocton expressed sequence tags lesis; and entomation relates to 1/80 cocton expressed sequence tags lesis; and from primed or non-primed seeds from variety DP50B, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septa from variety or tissue, developing fibres, carpel walls and septa from variety or tissue, developing fibres, carpel walls and septa from variety or tissue, developing fibres, carpel walls and septa from variety or comprising a nucleic acid of the invention. The cotton ESTs are useful as invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as members of a particular gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically significant genes are seed germination and catabolic pathways. The nucleic acid molecules are links in metabolic and catabolic pathways. The nucleic acid molecules are also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically catemes, genetic and molecular mapping, and in cloning of agronomically detecting the expression level or pattern of a protein or mRNA and for detecting the expression level or pattern of a protein or mRNA and corporation and cotton variety Nucotton338 androecium rissue printing in requence data for this patent did nelectronic form a protein better the sequence data for this patent did nelectronic form a protein better the pattern of the printing the expression are pattern of the printing genes associated with plant growth, quality or yield, and as molecular patent office at segdata.uspto.gov/sequence.html?DocID=US20040123340 The invention relates to 17880 cotton expressed sequence tags (ESTs; Claim 1; SEQ ID NO 7449; 34pp; English.

The present sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number and the clone it was derived from secreted human protein. The gene number and the clone it was derived from are given in the descriptor line. The invention relates to 31 novel genes and their fragments (nucleic acid sequences: AAA61260-A61293; amino acid sequences AAB12301-B12371) which are useful for preventing, treating or sequences AAB12301-B12371) which are useful for preventing, treating or pathological conditions e.g. by protein or gene therapy. Also pathological conditions can be disquosed by determining the amount of the new polymelectides. Specific uses are described for each of the 13 polymuclectides based on which tissues they are most highly expressed in and include products for the disgnosis or treatment of cancer, tumours, AIDS, autoimmune disorders, altergy, cardiovascular disorders, viral, bacterial and fungal infection. The genes are used to generate tusion proteins by linking to the gene a human immunoglobulin portion (AAA61251) for increasing stability of the fused protein as compared to
                                                                                                                           treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; neokine family; NBOKINE-1; non-NEOKINE chemokine; chemokine; proliferative disease; cancer; epithelia cancer; liver cancer; secretory gland cancer; bladder cancer; reproductive tract cancer; central nervous system cancer; connective tissue cancer; inflammation; psoriasis; immune rejection; skin graft; kidney transplant; stroke; ischaemia; viral infection; orphan chemokine receptor; RDC1; gene; ds.

```
The invention relates to NEOKINE proteins and their corresponding nucleic acid sequences. The nucleic acid molecules, polypeptides and antibodies of the invention are useful for diagnosing and treating NEOKINE.

Co fit invention are useful for diagnosing and treating NEOKINE.

Cassociated disorders, such as genetic disorders of the membrane transport (aminoacidurias, cystinosis), CNS disorders (Alzheimer's disease, CS epilepsy, Parkinson's disease), liver disorders, skeletal muscle disorders, cellular proliferative and/or differentiative disorders

C (cancer), hormonal disorders (diaberes, thyroid disorders), immune and conformancy disorders (laberes, thyroid disorders), cardiovascular disorders (laberes, thyroid disorders), cardiovascular disorders, neutrophil disorders

C (neutropaenia, lupus), testicular disorder (mumps) and platelet disorders. They are also useful in tissue typing, detection assays, and predictive medicine. The nucleic acids are useful as surrogate markers and also useful in gene therapy. The present sequence is human NEOKINE-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid molecules encoding NEOKINE proteins, useful diagnosing and treating kinase-associated disorders, such as diabetes, Alzheimer's disease, aminoacidurias.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0.6%; Score 25; DB 12; Length 2050;

                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an isolated NEOKINE nucleic acid molecule (I)

comprising a sequence of 1656, 300, 1372, 237, 1458 or 285 bp given in

the specification (designated 51-56, respectively) or their complements.

The NEOKINE molecules are useful as modulating agents in regulating a

variety of cellular processe, as primers or hybridisation probes for the

detection of NEOKINE-encoding nucleic assays, in screening assays, in

predictive medicine (e.g. diagnostic assays, prognostic assays, in

predictive medicine (or prophylactic). The nucleic acids are useful in

chromosome mapping, tissue typing, and in forensic biology. The proteins

can be used to treat disorders characterised by insufficient or excessive

production of non-NEOKINE chemokine or chemokine forms which have

can be used to treat disorders characterised by insufficient or excessive

production of non-NEOKINE chemokine or chemokine forms which have

carborant activity compared to wild type chemokines, and to

sorreen drugs or compounds which modulate NEOKINE activity. NEOKINE

diseases such as cancers of the epithelia, liver, secretory glands,

chaseases such as cancers of the epithelia, liver, secretory glands,

chaseases such as cancers of the epithelia, liver, secretory glands,

chaseases why transplant, and brain inflammation following skin

graft or kidney transplant, and brain inflammation following skin

characterized to the primer of productive transplant, and brain inflammation following skin

The invention relates to novel genes (ABA11004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tisques disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and covarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases auch as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                             encoding 3224 human nervous system antigen polypeptides, venting, diagnosing and/or treating nervous system cancers
                                                                                                                                      Disclosure; SEQ ID NO 12082; 1701pp + Sequence Listing; English

New isolated cancer-associated polynucleotides and polypeptides useful for diagnosing, preventing or treating cancers, especially lymphoma and leukemia, or in screening for agents that modulate cancer.

The invention relates to an isolated nucleic acid comprising at least 10 in the specification, or its complement. The nucleic acids encode cancerassociated proteins. Also included are an expression vector comprising the isolated nucleic acid cited above, a host cell comprising the above cancerassociated proteins. Also included are an expression vector comprising the above cancerassociated (CA) nucleic acid comprising at least one probe comprising at least 10 contiguous nucleotides of any of the 95 comprising frame of a CA sequence selected from any of the 95 comprising frame of a CA sequence selected from any of the 95 an open reading frame of a CA sequence selected from any of the 95 complement), an isolated antibody, or its antigen binding fragment) that complement, an isolated antibody, or its antigen binding fragment binds to the above polypeptide, a hybridoma that produces the above antibody and a pharmaceutical excipient, a kit for detecting cancer complement, a method for inhibiting growth of cancer cells in an individual, a method for inhibiting growth of cancer cells in an individual, a method for delivering a therapeutic agent to cancer cells in an individual, a method for delivering a therapeutic agent to cancer cells in an individual, a method for their fragments), methods of screening concern activity or for a bioactive agent capable of modulating the activity of a CA protein (CAP), methods for detecting the expression of for a bioactive agent capable of modulating cancer activity or for a bioactive agent capable of modulating cancer activity or for a bioactive agent capable of modulating cancer activity or for a bioactive agent capable of method for treating cancers and a method for inhibiting the expression of a polypeptide in a test cell sample of method for treating cancers and a method for inhibiting the expression of a polypeptide in a test cell sample. The semant sequence data for this patent did not form part of the printed cancer. The present sequence is a human CAP genomic sequence data f Sequence 142976 BP; 35484 A; 31242 C; 34145 G; 42085 T; 0 U; 20 Other; at ftp.wipo.int/pub/published_pct_sequences claim 16; seqid 125; 310pp; English. %XCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCCC

The invention relates to a method of determining susceptibility of an individual to joint space narrowing and/or osteophyte development and/or polymorphism in a polymorleid and/or osteophyte development and/or polymorphism in a polymorleid encoding at least one of the protein listed in the specification. The methods, composition and agent are narrowing and/or osteophyte development and/or joint pain that is associated with a disease, preferably osteoarthritis. The cell line and the non-human animal are useful for screening for an agent for diagnosing an individual having susceptibility to joint space narrowing and/or osteophyte development and/or joint space narrowing and/or osteophyte development and/or joint pain. This sequence corresponds to osteophyte development and/or joint pain. This sequence corresponds to the sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the nucleotide sequence of oligonucleotide 1107A, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 3856-3833 of the human methionine synthase cDNA open reading frame (see ANV34064-104) based on such conserved regions are provided. These have been used for human and mouse methionine synthase cDNA cloning,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;

This is the nucleotide sequence of oligonucleotide 1706A, a primer based on a highly conserved region found in the methionine synthases of different organisms. It corresponds to nucleotides 1963-1986 of the human methionine synthase CDNA does reading frame (see AAV34064). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These chave been used for human and mouse methionine synthase CDNA choning, chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency and associated altered risk for neutal tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve
                                                                                                                                                                                                                                                                                                                                                                                                                     ö
chromosome mapping and in a claimed method for mutation detection. Mutations in the human methionine synchase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and treatment of patients at risk for methionine synthase deficiency, and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve SSCP or RFLP polymorphism analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Methionine synthase; human; hyperhomocysteinaemia; neural tube defect; cardiovascular disease; colon cancer; diagnosis; therapy; PCR; primer;

It corresponds to nucleotides 3241-354 of the human methionine synthase cDNA open reading frame (see AAV34064). 41 Primers (see AAV34064-104) based on such conserved regions are provided. These chromosome mapping and in a claimed methionine synthase cDNA cloning, whitations in the human methionine synthase gene are associated with hyperhomocysteinaemia. The invention relates to the diagnosis and associated altered risk for methionine synthase deficiency, and associated altered risk for methionine synthase deficiency, and associated altered risk for metrion relates to the diagnosis and associated altered risk for neural tube defects, cardiovascular disease and colon cancer. Claimed methods for detecting sequence variants involve

Sequence 75, Application US/08980326

Patent No. 6703197

GENERAL INFORMATION:

APPLICANT: Gravel, Rum

APPLICANT: Gelerc, Daniel

APPLICANT: Campeau, Eric

TITLE OF INVENTION: HUMAN METHIONINE SYNTHASE: CLONING, AND

TITLE OF INVENTION: HUMAN METHIONINE SYNTHASE: CLONING, AND

TITLE OF INVENTION: METHODS FOR EVALUATING RISK OF NEURAL TUBE DEFECTS,

TITLE OF INVENTION: METHODS FOR EVALUATING RISK OF NEURAL TUBE DEFECTS,

TITLE OF INVENTION: CARDIOVASCULAR DISEASE AND CANCER

FILE REFERENCE: 50004/002003

CURRENT APPLICATION NUMBER: US/08/980,326

CURRENT PILING DATE: 1997-11-26

EARLIER FILING DATE: 1997-06-20
